

The neighbourhood graph of the Potts penalty, $n = 100$, $K = 3$

$\omega = 0$

$\omega = 0.7$

$\omega = 1$

knn = 3

mean degree 4.0

68% of edges cross

38% of edges cross

12% of edges cross

knn = 5

mean degree 6.4

70% of edges cross

42% of edges cross

13% of edges cross

knn = 10

mean degree 12.7

70% of edges cross

42% of edges cross

13% of edges cross

grey edges join two locations of the same true regime; red edges cross a regime boundary, and are the pairs the penalty rewards for agreeing when they should not
